An Evaluation of Soil Fertility Constraints in the Highlands of Papua New Guinea
THE INSTITUTE

The National Agricultural Research Institute (NARI) was established by an Act of National Parliament of Papua New Guinea (PNG) in July 1996 as a publicly funded, statutory research organisation, to conduct applied and development oriented research on food crops, alternative food and cash crops, livestock and resource management issues. Besides applied and adaptive research, NARI is responsible for providing authoritative technical, analytical and diagnostic services and up-to-date information to the entire agriculture sector in PNG. The major targets are the small-holder semi-commercial farmers in the country.

The mission of NARI is to promote innovative agricultural development in Papua New Guinea through scientific research, knowledge creation and information exchange.
An Evaluation of Soil Fertility Constraints in the Highlands of Papua New Guinea

Compiled by Bailey, J.S,¹ Ramakrishna, A.¹ and Krichhof, G.²

Technical Bulletin No. 22

December 2008

¹National Agricultural Research Institute, Highlands Programme, Aiyura, Eastern Highlands Province, PNG
²The University of Queensland, School of Land and Food Sciences, Brisbane, Queensland, 4072, Australia.
The views expressed in this information bulletin are those of the compilers and do not necessarily constitute or coincide with the opinions of the National Agricultural Research Institute.

# Table of Contents

Summary ........................................................................................................................................... 1  

1. Introduction .................................................................................................................................. 2  
  1.1 Soil fertility problems in the highlands of PNG ................................................................. 2  
  1.2 Identifying the causes of soil infertility using DRIS methodology .................................... 3  

2. Aims and Objectives of the Study ............................................................................................... 4  
  2.1 Aims ....................................................................................................................................... 4  
  2.2 Objectives ............................................................................................................................... 4  

3. The Data Base ............................................................................................................................ 4  
  3.1 Data collection and selection ............................................................................................... 4  
  3.2 Soil classification and clay mineralogy ............................................................................... 6  
  3.3 Potential problems with the data ......................................................................................... 7  

4. Methodology .............................................................................................................................. 7  
  4.1 Soil and plant analysis ......................................................................................................... 7  
  4.2 DRIS methodology ............................................................................................................. 8  
  4.3 Regression analysis and statistical procedures ................................................................. 9  
  4.4 Analyses of variance (ANOVA) and the Tukey test ......................................................... 9  

5. Results and Discussion ............................................................................................................. 9  
  5.1 Development of a DRIS model for sweet potato .............................................................. 9  
  5.2 The effects of garden and soil on tuber yield and soil attributes ....................................... 13  
  5.3 The effects of garden and soil type on leaf DRIS indices .................................................. 14  
  5.4 A negative correlation between soil CEC and soil organic C .............................................. 18  
  5.5 Relationships between leaf -P and soil-P in volcanic and non-volcanic soils .................. 21  

6. General Discussion ..................................................................................................................... 23  

7. Conclusions ............................................................................................................................... 25  

8. Innovative Strategies for Combating Soil infertility ............................................................... 25  
  8.1 Conservation of nutrient-rich ash from burnt vegetation .................................................. 26  
  8.2 Use of compost and green manure as an alternative to ‘slash and burn’ ......................... 26  
  8.3 Improving short-term fallow using NPK accumulator species ......................................... 26  
  8.4 Delayed-fertilised fallow ................................................................................................. 27  
  8.5 Liming to increase soil CEC and reduce P fixation ......................................................... 28  

Bibliography ................................................................................................................................... 30  

Acknowledgements ......................................................................................................................... 34
Other Technical Bulletins

3. Improved Taro Varieties with Resistance to Taro Leaf Blight for Papua New Guinea Farmers.
7. Strategies for Agriculture and Rural Development in Papua New Guinea.
9. Yam Germplasm Collection in PNG.
13. Soil and Plant Sample Collection, Preparation and Interpretation of Chemical Analysis.
15. Ownership and Management of Sheep and Goats in Three Highlands Provinces of Papua New Guinea.
17. Physico-chemical and eating qualities of selected rice varieties in Papua New Guinea.
